

Installation Dashboard

Install & Update Guide

Installation System · Version 1.2.12 · August 2026

A short guide for everyone using the Installation Dashboard. You install it **once**. After that it keeps itself up to date.

It installs like a normal Windows program — there is no website and no link to remember. The installer already knows where the office database is, so there is nothing to set up: install it, sign in with the username and password Nurul gives you, and you are working. Once it is running, the full manual covers the four workspaces, customer records and day-to-day use.

PART 1

Part 1 — Installing

Set aside about 5 minutes. You need a Windows PC (Windows 10 or 11) and an internet connection. There is nothing to install beforehand — the app brings everything it needs with it.

Ask Nurul for two things before you begin: your **username and password** for the app, and to be given access to the download page — it is private, so the link below only opens for a GitHub account that has been added to it.

Step 1 — Download the app

Sign in to **GitHub** with the account Nurul added for you, then go to the Installation Portal download page:

Installation Portal download page

- 1 If the page says **404 — Not Found**, you are either not signed in to GitHub or your account has not been added yet. Tell Nurul; there is nothing wrong with the link.
- 2 Scroll down to the **Assets** list.
- 3 Click the file starting `Installation-System-Setup` and ending in `.exe` to download it. Always take the newest version the page offers.
- 4 It will go to your **Downloads** folder unless you choose somewhere else.

Step 2 — Run the installer

- 1 Open the file you just downloaded.
- 2 If Windows shows a blue “Windows protected your PC” box: click **More info**, then **Run anyway**. This is normal — Windows shows it for any app it has not seen before.
- 3 Click **Next** through the screens. Tick **Create a desktop shortcut** if you would like one.
- 4 Click **Install**.

When it finishes you will have an **Installation System** shortcut on your desktop and in the Start Menu.

Step 3 — Open it for the first time

Start Menu → **Installation System** (or the desktop shortcut).

The first time you open it, the window may stay blank or white for a few seconds while it starts up. This is normal and only happens on the first launch — later launches are faster.

You should then see the **Installation Operations** sign-in screen. There is nothing to configure first — the connection to the office database came with the installer.

Step 4 — Sign in

Use the username and password Nurul gave you. Everyone has their own — your name is what appears against the changes you make.

- 1 Type your **username**.
- 2 Type your **password**. Click the eye icon at the end of the box to check what you typed before you send it.
- 3 Click **Sign in**.

You land on the dashboard, with today's date and **Malaysia time** at the top and your own name in the top right — click it to sign out. It remembers you for about a month, so on your own PC you will rarely have to sign in again.

You are done.

If it says **Incorrect username or password**, try again with the eye icon on so you can see the password. If it still refuses, ask Nurul to reset it rather than guessing — repeated failures are recorded.

Check the top right every time you open the app

It should say **Live source**. If it says **Demo source**, or you see customers called **DEMO CUSTOMER ONE / TWO / THREE**, the app cannot reach the database and those names are fake examples.

Anything you type in that state will not be saved. Check your internet connection, then close the app completely and open it again. If the demo names are still there, contact Nurul — do not carry on working. You should never have to type connection details in yourself; if the app asks for them, something is wrong.

PART 2

Part 2 — Updating

Short version: you don't have to do anything. The app checks for new versions by itself and tells you when one is ready.

When an update is ready

An **Install Update** button appears in the **top bar**, next to *Check for new jobs*, showing the new version number.

- 1 Click **Install Update**.
- 2 Wait. The button shows the download progress, then the app closes and reopens by itself on the new version. This takes a minute or two.
- 3 **Do not close the window while it is working.**

Things worth knowing

Nothing of yours is lost. All your data lives in the shared database, and the connection is kept separately from the program, so an update only replaces the program itself. You stay signed in.

You never download the installer again. Steps 1–4 above are one time only.

Take updates when they appear. An update can also carry a new database password. An app left un-updated for a long time can drop to **Demo source** for that reason alone.

To check your version: Settings → Apps → Installation System. The app itself does not show a version number on screen.

If an update fails, the app keeps working on the version you already have. Tell Nurul so it can be looked into.

TROUBLESHOOTING

If something goes wrong

WHAT YOU SEE	WHAT TO DO
Blue "Windows protected your PC" screen	Normal. Click More info → Run anyway
Window is blank or white	Wait 10 seconds. If still blank, close it completely and reopen
404 — Not Found on the download page	The page is private. Sign in to GitHub, and ask Nurul to add your account if it still will not open
Incorrect username or password	Turn on the eye icon and try again. Still refused — ask Nurul to reset it
It asks you to create the IT Admin account	Stop and tell Nurul. It means the app is pointed at an empty database — do not create anything
A Set up connection button is showing	The connection that ships with the app has not taken. Tell Nurul — do not type details in yourself
It says Demo source , or you see DEMO CUSTOMER names	Not connected. Check your internet, then close the app completely and reopen. Do not enter any data
Still on Demo source after reopening	Take any update the top bar offers, then reopen. If it persists, contact Nurul
Warning bar across the top	Read it — it explains what is not working
App will not start at all	Restart your PC, then try again
An update failed	Tell Nurul — the app keeps working on the current version
Anything else	Contact Nurul. Say what you were doing and what you saw

Please report problems rather than working around them.

In these early weeks, issues get fixed quickly — but only if someone says something. If you find yourself going back to Excel to get something done, that is exactly the thing worth reporting.

Nurul — for anything about the app: problems, questions, missing customers, or suggestions for what would make it easier to use.

Written for version 1.2.12. Nothing of yours is stored on your PC — all data lives in the shared database, so there is nothing to back up and nothing lost if your PC is replaced. A new PC just needs the installer and your sign-in. To uninstall: Settings → Apps → Installation System → Uninstall.
