

Installation Dashboard

Install & Update Guide

Installation System · Version 1.0.0 · August 2026

A short guide for everyone using the Installation Dashboard. You install it **once**. After that it keeps itself up to date.

It installs like a normal Windows program — there is no website to log into and no link to remember. Once it is running, the full manual covers the four tabs, customer records and day-to-day use.

PART 1

Part 1 — Installing

Set aside about 5 minutes. You need a Windows PC (Windows 10 or 11) and an internet connection. There is nothing to install beforehand — the app brings everything it needs with it.

Ask Nurul for the connection details before you begin: a server address, a database name and an access token. You enter these once, in Step 4, and never again.

Step 1 — Download the app

Go to the Installation System download page:

<https://github.com/NurulAqilahSaifulBahril/Installation-System/releases/latest>

- 1 Scroll down to the **Assets** list.
- 2 Click the file starting `Installation-System-Setup` and ending in **.exe** to download it. Always take the newest version the page offers.
- 3 It will go to your **Downloads** folder unless you choose somewhere else.

Step 2 — Run the installer

- 1 Open the file you just downloaded.
- 2 **If Windows shows a blue “Windows protected your PC” box:** click **More info**, then **Run anyway**. This is normal — Windows shows it for any app it has not seen before.
- 3 Click **Next** through the screens. Tick **Create a desktop shortcut** if you would like one.
- 4 Click **Install**.

When it finishes you will have an **Installation System** shortcut on your desktop and in the Start Menu.

Step 3 — Open it for the first time

Start Menu → **Installation System** (or the desktop shortcut).

The first time you open it, the window may stay blank or white for a few seconds while it starts up. This is normal and only happens on the first launch — later launches are faster. You should then see the dashboard, with today's date and **Malaysia time** at the top.

It opens showing **Demo source** in the top right. That is expected — it does not know where your database is yet.

Step 4 — Enter the connection details

This is the one-time setup. You need the three details from Nurul.

- 1 Click **Set up connection** in the top right.
- 2 Enter the **Server address** (it starts with `https://`), the **Database name**, and the **Access token**. The token stays hidden as you type.
- 3 Click **Save and connect**.

The list reloads by itself. When it works, the top right changes from **Demo source** to **Live source** and you will see customer names you recognise. **You are done.**

If it does not work, a message explains what was wrong and the box stays open so you can correct it. Usually it is a missing `https://` at the front of the address, or a space copied along with the token.

Check the top right every time you open the app

It should say **Live source**. If it says **Demo source**, or you see customers called **DEMO CUSTOMER ONE / TWO / THREE**, the app cannot reach the database and those names are fake examples.

Anything you type in that state will not be saved. Click the **Demo source** text to check your connection details, then check your internet connection and reopen the app. If the demo names are still there, contact Nurul — do not carry on working.

PART 2

Part 2 — Updating

Short version: you don't have to do anything. The app checks for new versions by itself and tells you when one is ready.

When an update is ready

An **Install Update** button appears in the **top bar**, next to *Check for new jobs*, showing the new version number.

- 1 Click **Install Update**.
- 2 Wait. The button shows the download progress, then the app closes and reopens by itself on the new version. This takes a minute or two.
- 3 **Do not close the window while it is working.**

Things worth knowing

Nothing of yours is lost. All your data lives in the shared database and your connection details are stored separately from the program, so an update only replaces the program itself. You will not be asked to set up the connection again.

You never download the installer again. Steps 1–3 above are one time only.

To check your version: look at the bottom-left panel.

If an update fails, the app keeps working on the version you already have. Tell Nurul so it can be looked into.

TROUBLESHOOTING

If something goes wrong

WHAT YOU SEE	WHAT TO DO
Blue “Windows protected your PC” screen	Normal. Click More info → Run anyway
Window is blank or white	Wait 10 seconds. If still blank, close it completely and reopen
A Set up connection button is showing	The connection details have not been entered yet. See Step 4
It says Demo source , or you see DEMO CUSTOMER names	Not connected. Click Demo source to check the details, then check internet and reopen. Do not enter any data
Saved the details but still on Demo source	Read the message in the box — usually a missing https:// or a stray space in the token
Warning bar across the top	Read it — it explains what is not working
App will not start at all	Restart your PC, then try again
An update failed	Tell Nurul — the app keeps working on the current version
Anything else	Contact Nurul. Say what you were doing and what you saw

Please report problems rather than working around them.

In these early weeks, issues get fixed quickly — but only if someone says something. If you find yourself going back to Excel to get something done, that is exactly the thing worth reporting.

Nurul — for anything about the app: problems, questions, missing customers, or suggestions for what would make it easier to use.

This is version 1.0.0. Nothing is stored on your PC — all data lives in the shared database, so there is nothing to back up and nothing lost if your PC is replaced. To uninstall: Settings → Apps → Installation System → Uninstall.
